

Canadian Post Real-Time Shipping Rate Module for ECWZ ASP Cart v1.x

Thank you for purchasing the Canadian Post module v1.x for ECWZ Classic ASP Cart.

Canadian Post Real-Time Shipping Module is a module that allows your online store to grab the shipping rate from Canadian Post during the checkout process (real-time).

This documentation contains installation instruction and Operational manual for you to install and operate with the Canadian Post Real-Time Shipping Rate module.

Note:

- a. If you are sending irregular shaped or oversized product, the real-time shipping rate might be different than the rate you will be charged with by Canadian Post. To find out whether your packages might fall into the irregular shaped or oversize package category, you should submit couple test order and compare with the returned rates.
- b. If you need to register for Canadian Post account, you can either register it at canadianpost.com.
- c. In order to use Canadian post, the outbound TCP port 30000 needs to be opened for your web server. You will need to contact your web hosting support to make sure this port is open for you.

Installation Instruction:

1. Unzip the canadianpost_realtime v1.x.zip and upload the unzipped files to the web server.

After you have downloaded the canadianpost_realtime v1.x.zip file from ECWZ.net, you will need to unzip this set of file into your local hard-drive. Here are the folder lists after the decompression of the zip file:

- a. /admin
- b. /store

Upload all the contents to the root of your site using any protocol you want (we recommend FTP protocol here). If you plan to put your store under your domain <http://www.mydomain.com>, then you must upload all the files into the web root folder of [mystore.com](http://www.mydomain.com).

Note: If you have purchased any of the skin template set, then the skin template set should include the skin files for this module already. If your skin file set does not include files for this module, contact us at ECWZ.NET and we will email you a set of the files for the skins you have purchased.

2. Executing the sql.txt file to install the module into your store.

After uploading files into your web root, you need to execute the SQL statements in the sql.txt file in order to install the modules into your online store. You can use any text editor to open the SQL.txt file and execute those statements with any kind of database management tool. Keep in mind that some DB Management tool might have problem executing the "GO" keyword. If that's the case, you might have to execute these statements one by one.

3. Recreate your language profile.

After you run the SQL statements, there will be new entries for the language text stored into your textlayertbl table. In order for your online store to load these new languages text, you will need to log into the back-end admin of your store -> Store Configuration -> Edit Language -> and click on the Process button to recreate the text layer file (Feel free to edit the text information for this module).

4. Back-end Configuration for Canadian Post Real-Time Shipping Rate module.

4-1. module_canadianpost_realtime.asp

- a. Canadian Post ID:** This setting stores the account ID for your Canadian Post account.
- b. Status:** You can enable or disable this shipping option.
- c. Your Zip Code:** This setting will store your zip code for your shipping location (this setting needs to be Canadian zip code).
- d. Weight Unit:** This setting stores the weight unit for your shipping rates.

5. Script Editing

In order to install the UPS Real-Time shipping module, there are two script-editing you need to do. First, use any html editor or text editor and open the following file:

Storeroot/store/includes/shippingbuilder.asp

1. At the first line, (before the <% tag), add the following line:

```
<!--#include file="../moduleclass/ canadianpost_class.asp"-->
```

2. Go to line 83 (after the comment of “using real-time shipping module”) add the following code:

```
'canadian post shipping

if shippingRS("smethodmode") = 4 then

    if lcase(session("sstate")) = "zz" then

        vmystate=session("sOutofUS")

    else

        vmystate = session("Sstate")

    end if

    myshippingString = myshippingString & CanadianPost (mytotalweight , session("scity"),
vmystate, session("scountry"),session("szip"), shippingcount)

end if
```

Once you done, just click on save and re-upload this file to overwrite the existing file.

6. License Information

For any questions in regards to the open-source license of this module, please contact ECWZ.NET for the licensing information.

7. Support Issue

For any support request/issue, please visit ECWZ, Inc’s support page at <http://www.ecwz.net/corporate/support.asp>.
