

# eWay Module for ECWZ ASP Cart v1.x

Thank you for purchasing the eWay module v1.x for ECWZ Classic ASP Cart.

EWay is an API-based solution provided by surepay.com on credit card processing payment gateway. This add-on module is used to integrate your ECWZ shopping cart with the EWay solution. It is an easy installation and can be done within 5 ~ 10 min. For more information about EWay's API, visit <http://www.eWay.com.au>

This documentation contains installation instruction and Operational manual for you to install and operate with the EWay module.

## Installation Instruction:

### 1. Unzip the EWay v1.x.zip and upload the unzipped files to the web server.

After you have downloaded the EWay v1.x.zip file from ECWZ.net, you will need to unzip this set of files into your local hard-drive. Here are the folder lists after the decompression of the zip file:

- a. /admin
- b. /store

Upload all the contents to the root of your site using any protocol you want (we recommend FTP protocol here). If you plan to put your store under your domain <http://www.mystore.com>, then you must upload all the files into the web root folder of mystore.com.

Note: If you have purchased any of the skin template set, then the skin template set should include the skin files for this module already. If your skin file set does not include files for this module, contact us at ECWZ.NET and we will email you a set of the files for the skins you have purchased.

### 2. Executing the sql.txt file to install the module into your store.

After uploading files into your web root, you need to execute the SQL statements in the sql.txt file in order to install the modules into your online store. You can use any text editor to open the SQL.txt file and execute those statements with any kind of database management tool. Keep in mind that some DB Management tool might have problem executing the "GO" keyword. If that's the case, you might have to execute these statements one by one.

### 3. Recreate your language profile.

After you run the SQL statements, there will be new entries for the language text stored into your textlayertbl table. In order for your online store to load these new languages text, you will need to log into the back-end admin of your store -> Store Configuration -> Edit Language -> and click on the Process button to recreate the text layer file (Feel free to edit the text information for this module).

## **4. Back-end Configuration for EWay module.**

### **4-1. module\_eWay.asp**

**a. Payment Status:** This setting is the config to enable/disable this paypal web payment pro credit card processing method.

**b. eWay Account ID:** This ID is assigned by the EWay payment gateway company. If you do not know your merchant account ID with EWay, please contact the EWay's support team.

**c. Charge Mode:** This setting is for store owner to choose either to charge customer at the end of the online purchase (if it is set to "Online") or to charge customer before shipping the items to customer at the order management under administration area (if it is set to Offline)..

## **5. License Information.**

For any questions in regards to the open-source license of this module, please contact ECWZ.NET for the licensing information.

## **6. Support Issue**

For any support request/issue, please visit ECWZ, Inc's support page at <http://www.ecwz.net/corporate/support.asp>
